3	COST ANALYSIS	4
3.1	PHASE I – NETWORK SWITCHES AND CABLING	4

1 PURPOSE AND OBJECTIVES

Trifour-Health have requested Sautech (PTY) Ltd. to perform a light audit on the slow response to the Trimed Hospital System hosted onsite within the Parirenyatwa Group of Hospitals infrastructure. The objective of this audit was to identify issues within either the infrastructure; or network infrastructure.

2 BACKGROUND OF SERVICES

2.1 Network Audits

Sautech performed the following audit (as this was an initial audit) and used the following technologies to receive our results:

1. NMAP (Network Mapping Software)
2. Belarc (Machine specifications and software inventory (selected machines))
3. Port Mapping Software
4. IP Mapping Software
5. Device Identification Software

Sautech does not have full access to the infrastructure and thus, performed a light audit to identify initial first phase issues.

Our results are as follows:

- Networks are extremely slow and the reason for this is old network switches, 10/100mb speed hubs identified throughout the network.
 - The reason for this we cannot directly explain, but the presumption is that as areas expanded, without laying new cables or expanding the core network switches, a “quick” fix was installed to expand the network with cheaper network infrastructure switches. These switches as a first phase needs to be upgraded
 - New network cabling needs to be connected from areas to the core infrastructure.
- The above, as stated, is the first stem in rectifying and stabilizing the remote network (not core infrastructure, as we don't have direct access).
- Once the above is completed to satisfactory, Phase II can commence as per below:
 - Upgrade core infrastructure switches
 - Upgrade user software to Office 365 in order for the new office packages and windows operating systems to be installed (currently mostly Windows 10 and Office 2013 installations)
 - There is no more support for office 2013, not more security updates and poses a security risk
 - Introduce proper WSUS for updates and to save bandwidth
 - Introduce AI EPR Anti-Virus system for effectiveness and centrally controlled managed services.

3 COST ANALYSIS

3.1 Phase I – Network Switches and Cabling

Due to the fact that we do not have the exact length of cabling required, including difficulty laying the cables, Sautech thus proposes that we quote and estimate on per meter cabling, per hour labour and 5-10 network switches.

For budgeting purposes, we will quote on estimates and offer to have Pari pay this invoice over 12 instalments. Please note, we have not included flights nor accommodation into this quotation and this will be quoted separately upon acceptance.

Description	Qty	Unit Price (USD)	Total
Network Cabling per meter incl installation	1000	\$1,50	\$1 500,00
Labour Onsite per hour	90	\$30,00	\$2 700,00
Ubiquity 16 Port Gigabit Switch	6	\$350,00	\$2 100,00
Cisco Core Switch (48 Port 3750)	2	\$2 800,00	\$5 600,00
Total (excluding VAT Tax)			\$11 900,00
12 Installments			\$991,67

Once the above is accepted, we will provide a quotation for the contents of the cost analysis. These costings are there to highlight what is needed as a Phase I, and our initial findings. Should Parirenyatwa Group of Hospitals wish to have us onsite to perform an in-depth quote / analysis on Phase II (as explained above), Sautech will be happy to submit a proposal.

Regards,

Riaan van Jaarsveld
